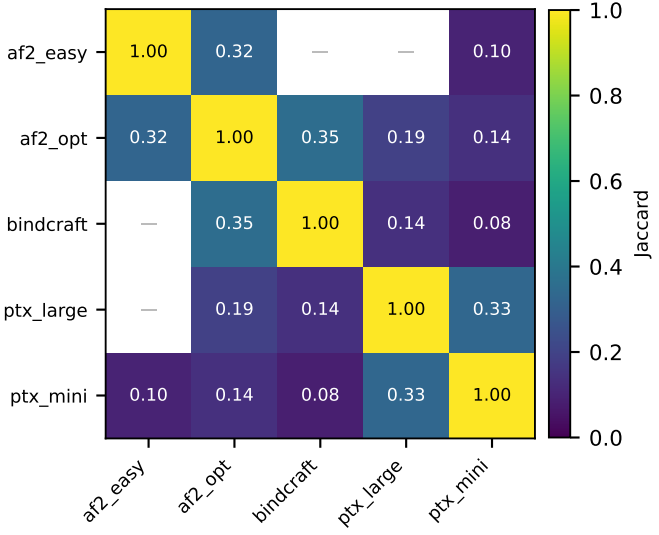
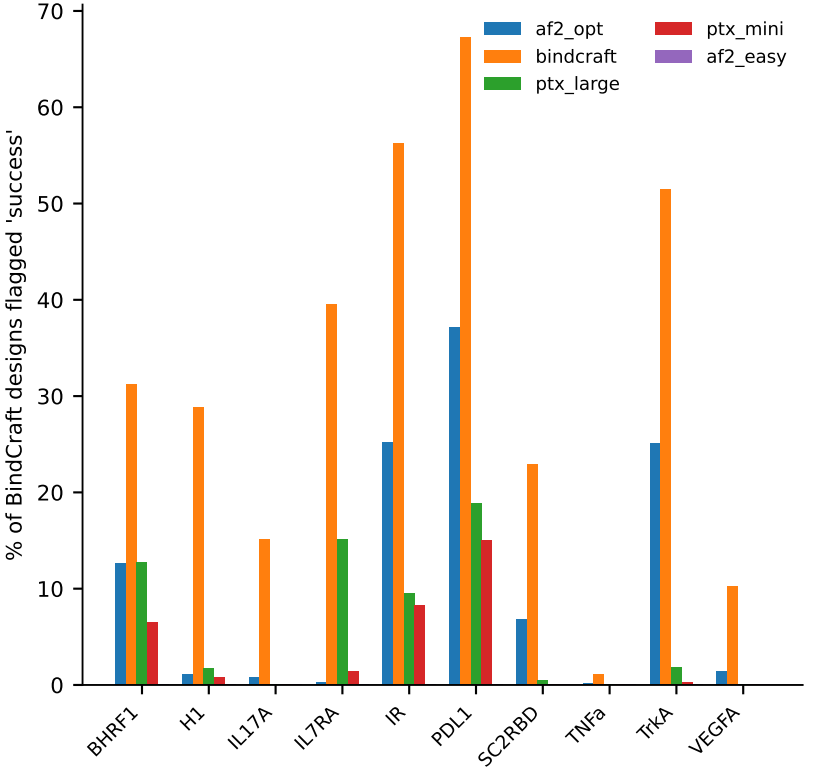
F10 The label-definition protocol axis (all labels deterministic → zero label noise)

F10a Design-level Jaccard between the 5 published success definitions



F10b One generator (BindCraft), one target set, 5 definitions: the target-difficulty ranking itself changes



F10c How the definitions nest (BindCraft / 10_targets, n=30,992)

`af2_opt_success` ⊂ `bindcraft_success`
(3,792 shared; 0 in af2_opt but not bindcraft; 6,922 in bindcraft only)

`ptx_mini_success` ⊄ `bindcraft_success`
(918 shared; 9,796 bindcraft-only; 199 ptx_mini-only)

bindcraft_success ⊇ af2_opt_success
→ the loosest definition contains every design the stricter one accepts.

12 distinct 5-bit verdict patterns exist:
the definitions are not nested in general.
